data request, response flow and Axios
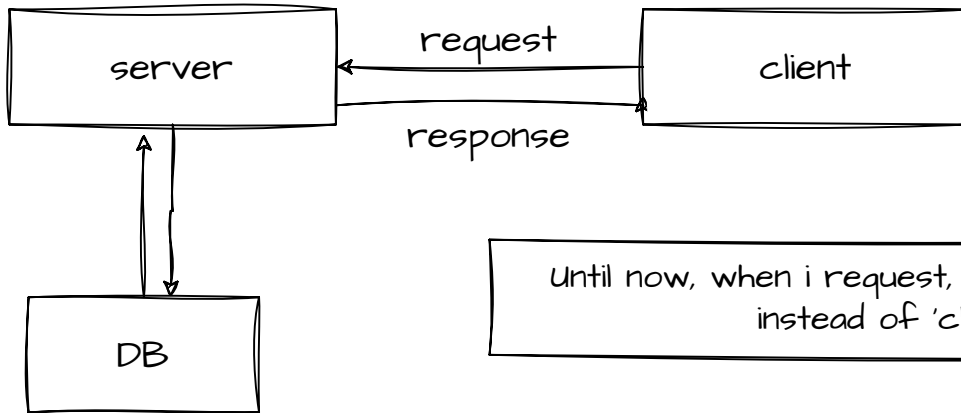

```
server  <--- request --- client
        --- response --->
  |  ^
  v  |
 DB
```

Until now, when i request, i used POSTMAN instead of 'client'

Now, when i request, i can use Axios in ReactJS. Axios is like AJAX in JQuery.

`npm install axios --save`

when we send 'request' by using axios, Error occurs. WHY??

client port is 3000 = localhost:3000,
server port is 5000 = localhost:5000.
without any configuration, we can not send request.
WHY? => CORS(Cross-origin resource sharing).

because of cyber security => we need to use CORS => how to solve? => Proxy => https://create-react-app.dev/docs/proxying-api-requests-in-development/

npm install http-proxy-middleware --save

npm install concurrently --save

npm install antd --save
