Redux setting

1. redux
2. react-redux
3. redux-promise
4. redux-thunk

What does Redux-promise, Redux-thunk do?
They are middleware! => A basic Redux store will only accept dispatching plain object actions. => but it doesn't always get plain object

So, the middlewares can 'teach' dispatch() how to accept something that is not a plain actio,n object, by intercepting the value and doing something else instead.

Redux-thunk teaches dispatch how to accept functions, by intercepting the function and calling it instead of passing it on to the reducers.
Redux-promise teaches dispatch how to accept promises, by intercepting the promise and dispatching actions when the promise resolves or rejects.
